## An Introduction to Blueberries

## Mark Longstroth Extension Fruit Educator

## Blueberries

- Minor fruit crop of American origin
- Perennial shrub
- New shoots from crown every year
- Bears fruit on last-year's wood
- Requires pruning to maintain young shoots
- Requires moist soils

## Growing Blueberries

- Requires Special Soils
- Soil pH 4.5 to 5.5
- Usually Acid Sands or Acid Mucks
- Soil Should be Moist, But Not Wet
- Originally a Wetland Plant

## Blueberry sites

- Porous soils with high water tables.

## Basic Plant Physiology

- Stems
- Leaves
- Roots
- Fruit
- All made of cells
- Cell growth
- Growth from meristems
- Competition

## Plant Growth

Three ways that plants grow.

- Cell Division
- Cell Expansion
- Cell Differentiation

Cell Division occurs

- Apical meristems (shoot and root tips)
- Cambium (cell layer makes wood \& bark)

## $\left.\frac{\text { MICHIGAN STATE }}{\text { UN IVERSITTY}} \right\rvert\,$ Extension

## Plant Organs

- Stems
- Buds
- Leaves

- Flowers \& Fruit
- Roots
- Annual Growth Cycle

## Leaves

- Green - chlorophyll
- Harvest light
- Carbon Dioxide + Water =
- Sugar + Oxygen
- Photosynthesis
- Plants make their Food

## Leaves

- Harvest Light Photosynthesis
- Stomates let air in and water out
- Stomates on bottom of leaf
- Transpiration
- Leaf Structure
- Leaf designed to conserve Water

## Stems

- Provide support
- Transport water from the roots (xylem) and sugars from the leaves (phloem)
- Storage of sugars and protein for later growth
- Annual Cycle of Shoot Growth and Flower Development

## Roots

- Anchor plant
- Absorb water
- Absorb nutrients
- Storage

## Roots

- Root Growth and Structure
- Absorb Water (passive)
- Absorb Mineral Nutrients (Active or passive)
- Root structure affects absorption
- Blueberries lack root hairs
- Mycorrhizal Fungi
- Blueberries have a small shallow root system.

## Blueberry Root

Water carries Nutrients into Cortex

Cortex moves nutrients past Casparian Strip and this draws water into the root

## Root Growth

## White root

## Zone of Maturation

Zone of Elongation
Apical Meristem at tip

Root Cap

## Blueberry Root Zone

## Competition

- Sources vs. Sinks
- Sources
- Leaves - carbohydrates
- Roots - water
- Storage tissues
- Sinks
- New growth
- Fruit
- New shoots
- New roots

## Annual Shoot Growth

D

## Dormant Shoot

- Fruit Buds at Tip
- Withered flower

Cluster at Base

- Vegetative buds on lower nodes
- Growth begins at tip

## Bud break

- Flower buds swell first.
- Leaf buds begin swelling from shoot tips down the shoot.
Leaf bud stages here are:
- 4 mm green
- 2 mm green
- green tip

## Spring Growth

- Flower bud opens and Blooms
- Rapid shoot expansion from vegetative buds
- Growth continues as long as conditions are good
- Buds develop in axils of leaves

## Spring Growth

## Spring Growth

## Mid-Summer Growth

- Shoots are competing with fruit
- Shoot tip dies
- Shoot growth stops
- New terminal bud develops in axil of uppermost leaf
- Leaf buds develop below

## End of Growth Flush

- Terminal Bud Dies
- Shoot growth stops
- No new leaves
- New terminal bud develops in axil of uppermost leaf
- Leaf buds develop in all leaf axils

## Bud Set - End of Growth

Actively Growing
New leaves at shoot tips

## No Growth

No new leaves

## $\left.\frac{\text { MICHIGAN STATE }}{\text { UNIVERSITYY }} \right\rvert\,$ Extension

## Late Summer and Fall Growth

- Fruits Ripen
- Terminal bud develops into flower cluster bud
- Lower buds may develop into Flower buds also

## Late Summer Flower Buds

## $\left.\frac{\text { MICHIGAN STATE }}{\text { UNIVERSITY Y }} \right\rvert\,$ Extension

## Fruit Growth

- Double Sigmoidal Growth Curve
- Competition between fruits
- First fruit are the Largest Fruit
- Small Fruit are Always Small

## Shoot Fruitfulness

- Fruit buds form on last year's wood!
- Vigorous shoots usually have lots of flowers and grow vigorous new shoots for next years crop.
- Less vigorous shoots have few buds on only one or two small shoots with one fruit bud.
- The most fruitful canes are 4 to 6 years old.

## Benefits of Mulches

- Increase Organic Matter
- Provide micronutrients increasing fertility of topsoil.
- Increase water holding capacity of soil
- Cool soil in hot summer
- Blueberry roots love the interface between the mulch and the soil.
- Just like Home!

## $\left.\frac{\text { MICHIGAN STATE }}{\text { UN IVERSITY }} \right\rvert\,$ Extension

- These 3-year old blueberries were both grown in silty clay loam but the one on the right received a 6 inch sawdust mulch

## Mulching and Root Growth

- Mulching increases fine root numbers.

## Blueberry Sites

- Low pH soils. Below 6!
- Moist soils, ability to irrigate, or drainage

## Blueberry Sites

## Blueberry Establishment: Does and Don'ts

- Preplant decisions
- Choosing the right site.
- Preparing the site.
- Planting mistakes
- Cultural mistakes
- Irrigation
- Herbicides
- Mulching

## Site Analysis

- Is this a blueberry site?
- Soil pH
- Is an acid soil
- Can I make it acid enough for blueberries.
- Naturally moist soil.
- Poor drainage.
- Water table close to surface.
- Is drainage needed?

## Blueberry Site Preparation

- Determine soil pH with a soil test.
- Below pH 5.5
- Best between pH 5-4.5
- Use Sulfur to lower pH
- 500\#/A, sand from pH 6 to 4.5
- Order plants.
- Control perennial weeds.
- Determine if drainage needed
- Prepare irrigation system.

## Soil pH and Availability

- Solubility and availability of most minerals is influenced by soil pH .
- Extreme pH can cause mineral deficiencies or mineral toxicities.

## This blueberries has an Iron deficiency from a high soil pH

## Lowering Soil pH

- Ammonium nitrogen fertilizers

Ammonium sulfate slowly lowers pH.

- Elemental sulfur can be used before planting to really lower the pH .
- Iron sulfate (6 times sulfur requirement)
- Acids in irrigation water

## Lowering Soil pH with Sulfur

- Is not a rapid chemical reaction.
- Bacteria use the sulfur for energy and change the sulfur to sulfuric acid.
- It is a slow biological process.
- Soil must be moist. Not Wet! (hydrogen sulfide kills)
- Soil temperature must be 55 F (13 C).
- Conversion takes place in the summer and fall, nothing in winter and early spring.
- Don't apply more than $500 \mathrm{lb} / \mathrm{A}$ to annually blueberries or you can injure the plants

## Lowering Soil pH with Sulfur

 Sulfur needed to lower soil pH to 4.5|  | Soil Type |  |  |
| :---: | :---: | :---: | :---: |
| Soil pH | Sand | Loam | Clay |
| 5.0 | 175 | 530 | 800 |
| 5.5 | 350 | 1030 | 1600 |
| 6.0 | 530 | 1540 | 2300 |
| 6.5 | 660 | 2020 | 3030 |
| 7.0 | 840 | 2560 | 3830 |

## Planting: Dos and Don’ts

- Don't plant before soil amendments have worked.
- Do break up the root ball when planting.
- Roots never come out of the peat!
- Small root mass dries quickly.
- Do add peat to the planting hole.
- Do mulch the plants
- Do Irrigate the planting

## ueberries

Breakup root ball May need to add organic matter in planting hole.

The peat pot of this plant is clearly visible and dries out quickly. A good candidate for mulching

## Fertilizing Blueberries

You need to use the correct nutrients

## Optimize Fertility

- Soil tests reveal what is in the Soil, not what the plants is getting from the soil.
- Leaf Analysis, Tissue tests reveal what nutrients are in the plant and if any are deficient.
- Law of the Minimum: Plant growth is dependent on essential elements and growth will be limited if one of these elements is limited. When that essential elements is added the plants growth is contained by another deficient element.
- Luxury Consumption, when an element is abundant the plant will absorb more than it needs. Can cause deficiencies.

## Fertilizing Blueberries

- For annual plants corn, tomatoes

More fertilizer = bigger plant, higher yield

- Blueberries are perennial plants

Nutrients are recycled from year to year
Fertilizer this year increased growth this year Increased yield next year
Too much fertilizer = too much growth
Too much shoot growth reduces yields.

## Fertilizers

- Too much fertilizer can cause more problems than not enough.
- Foliar nutrients are OK but can also be overdone.

## Nitrogen Fertilizers

- Annual applications,
- Use only ammonium N,
- Split application are best.
- Bud break \& after bloom
- More on sandy soil, less on heavier or organic soils
- Mulching increases demand for Nitrogen.
- Need to adjust Nitrogen based on growth and crop

## Nitrogen Fertilizers

- Urea 46-0-0

Use if soil pH is below 5

- Ammonium Sulfate (AMS) 21-0-0

Use if soil pH is above 5 to lower soil pH

- Cost per pound of nitrogen is important, not cost of fertilizer.
- Urea is $\$ 605 /$ ton and $46 \% \mathrm{~N}$

## 920\# N

- Urea N is $\$ 0.66$ a pound
- AMS is $\$ 390$ and $21 \% \mathrm{~N}$
- AMS N is $\$ 0.97$ a pound?

## Nitrogen per Acre

Nitrogen Recommendations for Michigan Blueberries(lb/acre, broadcast).

| Age <br> (years) | $\mathbf{N}$ | Urea | Ammonium <br> sulfate |
| :---: | :---: | :---: | :---: |
| 2 | 15 | 35 | 75 |
| 4 | 30 | 70 | 150 |
| 6 | 45 | 100 | 215 |
| 8 | 65 | 150 | 300 |

## Nitrogen per Plant

Nitrogen Recommendations for Michigan Blueberries (oz/plant).

| Age <br> (years) | N | Urea | Ammonium <br> sulfate |
| :---: | :---: | :---: | :---: |
| 2 | 0.2 | 0.4 | 1.0 |
| 4 | 0.3 | 0.65 | 1.5 |
| 6 | 0.5 | 1.0 | 2.5 |
| 8 | 0.7 | 1.5 | 3.3 |

## Fertilizers

- If you fertilize plants individually, Do not put the fertilizer on the plant.
- Put the fertilizer in a loose ring at least 6" from the plant.
- Don't burn the roots off with salt.

## Soil Nutrient Levels

- Nutrient levels are higher in heavier clay soils and organic than sandy soils,
- Relative proportions of nutrients is an important measure of status.
- A suitable balance of soil $\mathrm{Ca}, \mathrm{Mg}$, and K as percent of exchangeable bases,
- $60-80 \% \mathrm{Ca}$,
- $15-30 \% \mathrm{Mg}$,
- 10-15\% K.

## Phosphorus Fertilizers

Most phosphorus fertilizer do not dissolve well in acid soils, these do.

- MAP Monoammonium phosphate 11-48-0
- DAP Diammonium phosphate 18-52-0
- APP Ammonium Polyphosphate 15-62-0

## Potash Fertilizers

- Potassium Sulfate 0-0-50
- Potassium Magnesium Sulfate (Sul-Po-Mag) 0-22-0-11-22

N-P-K-Mg-S

- Potassium Chloride 0-0-60

## Blueberry Nutrition

- Blueberries are perennial plants and recycle their nutrients form year to year.
- Soil availability of nutrients is a poor measure of how to fertilize the plant.
- Tissue tests measure how much of each nutrient is in the plant.
- Tissue test are taken in late July.

## Blueberry Leaf Analysis

| Nutrient | Deficient | Sufficient | Excess |
| :--- | :---: | :---: | :---: |
| $\mathrm{N} \%$ | $<1.7$ | $1.7-2.1$ | 2.3 |
| $\mathrm{P} \%$ | $<.08$ | $0.08-0.4$ | 0.6 |
| $\mathrm{~K} \%$ | $<0.35$ | $0.4-0.65$ | 0.9 |
| $\mathrm{Ca} \%$ | $<0.13$ | $0.3-0.8$ | 1.0 |
| Mg \% | $<0.10$ | $0.15-0.3$ | - |
| $\mathrm{E}-2011: ~ M a n a g i n g ~ t h e ~ N u t r i t i o n ~ o f ~ H i g h b u s h ~ B l u e b e r r i e s ~$ |  |  |  |

## Irrigating Blueberries

## If you don't water them they won't grow

## Water

- Vital to Chemistry-Photosynthesis
- Transports materials
- Vital to Growth - Expansion
- Reduced water = smaller plants
- stems, leaves, fruits
- Reduced water = more roots

Plant Water Use

- Plants use little water if they have no leaves.
- As the leaves grow water use increases (Photosynthesis, transpiration).
- Organs grow by expansion.
- Pumped up by water.

## Soil Plant Atmosphere Continuum

Evaporation pulls water out of the soil into the plant

## Atmosphere

## Soil

## Minirlum Demano

## MICHIGAN STATE $\mid$ Extension

## Water Management

- Irrigation adds supplemental water and maintains water in the soil.
- Drainage removes excess water.
- Mulching reduces evaporation and moderates soil temperature.
- Blueberries have a small shallow root system.

## Why Irrigate Blueberries

- Plant Growth is Dependent on Water.
- Shoot Growth
- Fruit Growth
- Fruit Set for Next Year
- Blueberries do not manage water well.
- Moist soil is required for good blueberry growth.

## Drought Stress

## Drought

- Lack of water reduces photosynthesis and causes wilting
- Reduced growth and reduced food reserves available for growth
- Available reserves are shifted to the roots.
- Fruit compete for available reserves

## 害

## 2005 Cumulative Water Deficit (inches)

## Drought

## Drought

## Irrigation

- How much water is the plant using?
- How much water can the soil hold?
- How much water can you apply?
- How much rain have you received?
- Soil should be recharged when soil water is 50\% of capacity.

## Water Deficit

- Soil Water Storage
- Plant Water Use
- Evapo-transpiration
- Precipitation
- Irrigation

## Blueberry Water Use

- Plants use little water if they have no leaves.
- As the leaves grow water use increases
(Photosynthesis, transpiration).
- Organs grow by expansion.
- Cells are pumped up by water.

## Sandy soils do not hold much

 writer- Smaller more frequent ingations that do not over fil the soil are better than heay irfigation cycles? fort hay wash nutuents from the soil

## Soil Water Holding Capacity

| Soil Texture | in/in | $\ln / \mathrm{ft}$ |
| :--- | :---: | :---: |
| Sand | $0.07-0.10$ | $0.84-1.20$ |
| Sandy Loam | $0.09-0.15$ | $1.08-1.80$ |
| Loam | $0.14-0.19$ | $1.68-2.28$ |

## Water Use in Blueberries

| Month | Monthly Use | Weekly Use | Daily Use |
| :--- | :---: | :---: | :---: |
| May | 0.48 | 0.12 | 0.02 |
| June | 2.87 | 0.72 | 0.10 |
| July | 5.09 | 1.26 | 0.17 |
| August | 2.13 | 0.53 | 0.07 |

## Soil Water Holding Capacity

| Soil Texture | $\operatorname{In} / \mathrm{ft}$ | $\mathrm{in} / 18 \mathrm{in}$ |
| :--- | :---: | :---: |
| Sand | $0.84-1.20$ | $1.26-2.40$ |
| Sandy Loam | $1.08-1.80$ | $2.16-3.60$ |
| Loam | $1.68-2.28$ | $3.36-4.56$ |

## $\left.\frac{\text { MICHIGAN STATE }}{\text { UNIVERSITYY }} \right\rvert\,$ Extension

## Water Management

- Sandy soils do not hold much water
-1 to 2 inches
- Irrigation should be about half of soil capacity.
- Continually recharge as soil gets to $50 \%$ of soil moisture.

## Irrigation in Blueberries

| Month | Weekly Use | Soil holds 1 in | $50 \%$ |
| :--- | :---: | :---: | :--- |
| May | 0.12 | 8 weeks | 4 weeks |
| June | 0.72 | 10 day | 5 days |
| July | 1.26 | 5.5 days | 2.5 days |
| August | 0.53 | 13 days | 1 weeks |

## Irrigation in Blueberries

| Month | Weekly Use | $50 \%$ recharge |
| :--- | :---: | :---: |
| May | 0.12 | Every other <br> week |
| June | 0.72 | Every 5 days |
| July | 1.26 | Every 3 days |
| August | 0.53 | Every week |

## Irrigation Types

- Trickle
- Cheap
- Slow application rate
- Sprinkler
- Expensive
- Lots of water,
- Frost protection

## $\left.\frac{\text { MICHIGAN STATE }}{\text { UNIVERSITYY }} \right\rvert\,$ Extension

## Blueberry Water Measurements

- Acre inch = 27,156 gals
- . 2 inches = 5,431 gals
- 1452 blueberry plants / acre ( 10 ' rows and 3 ' between plants)
- 3.7 gal/plant/day ~ 4 gal/day
- Critical times - May to September Bloom > berry sizing > flower bud forms
- 2 inches a week during hot harvest!

## Pruning

- Remove older less productive wood
- Directs growth into new wood which is more fruitful.
- Better distribution of fruit buds by avoiding lots of short shoots with single buds.

## Pruning Young Bushes

First 2 seasons:
-Remove flower buds
(strip off or prune off).
-Remove low-growing, spindly branches to encourage upright vigorous wood.

## MICHIGAN STATE <br> Extension

## Younger Elliott

## Goals: pruning mature bushes

1. Promote new replacement canes.
2. Open canopy to increase flower bud initiation, reduce disease.
3. Balance leaf area and fruit load for good berry size.
4. Shape bush so base is narrow and fruiting wood is off the ground.

## Desired Cane Mix for Jersey/Bluecrop/Elliott

15-20 \% young canes (1-2 year-old) 60-70 \% intermediate (3-5 year-old)
$15-20 \%$ older ( 6 years and older)

## Mature Jersey bushes (\% Micivilicir lixfanion

## Example SWD spray programs

2013 example spray program

| Timing | Product | Rate |
| :---: | :---: | :---: |
| 7 July | Imidan 70WP | 1.3 lb |
| 12 Ju | ero | 6 oz |
| 21 July |  | 402 |
| 4 August |  | 40 oz |
| 8 August |  | 1.3 lb |
| 16 Aug | midan 70 W | 1.3 lb |
| 29 August | ULV malathion | 10 oz |

Some long intervals
Rate of Hero
Two chemical classes
Poor rotation

2014 spray program

| Timing | Product | Rate |
| :---: | :--- | :---: |
| First SWD, <br> if ripe fruit | Imidan | 1.3 lb |
| $+\mathbf{7}$ | Danito | 16 oz |
| +14 | Delegate | 6 oz |
| +21 | Exire | 10.5 oz |
| +28 | Lannate | 1 lb |
| +35 | Panitol | 16 oz |
| +42 | Imidan | 1.3 lb |
| +49 | Mustang Max | 4 oz |

Tighter spray intervals
Five chemical classes
Better rotation

## SWD insecticidal control in 2016

- Prune to open bush canopy
- Focus control on the fruit ripening/harvest period
- Respond rapidly to fly detection if berries are ripe.
- Use effective rates of effective products.
- Nu Lure for enhanced intake of insecticide.
- Use a sticker with Delegate.
- Tighten intervals (weekly).
- Improve spray coverage (gallons, speed, pruning, rows).
- Reapply after rain.
- Know the seasonal limits, PHI, REI, etc.

## Blueberry Pesticide Recommendations

Crop specific information
Blueberries, pages 229-246
Herbicides, page 255; BB p. 271
Recordkeeping information

## What Does It All Mean?

- Understanding what is unique about blueberries is important for maximizing yields
- Proper water management insures good plant growth and large fruit
- Pruning increases fruit size.
- Pest and disease control is important to maintain fruit quality

| MICHIGAN STATE |
| :--- |
| 1 IV | Extension

Michigan is the number one state in highbush blueberry production with growers producing over 100 million pounds of blueberries every year. This website was developed by Michigan State University's Blueberry Team to communicate information about blueberry production and pest management for the blueberry industry.

## Blueberries on MSUE News

臯 Do you need a brush-up on pest management basics? MSU's Integrated Pest Management (IPM) Academy is a quick, concentrated way to update your IPM skills. Join us on the MSU campus February 20-21.

Who is eating the produce that I grow?
When adopting food safety practices on the farm, it's important to remember why and for whom it is being done.
